

SafeStar Products Whole Home/Business Filtration System #2

For Use With City Water

**We put burglar alarms,
smoke & fire alarms in our
homes and businesses,
but we are doing nothing
to protect ourselves
from those *little micro-
terrorists coming in
through the water mains.***

Better Than Bottled Water ...

Using city water, SafeStar's Water Filtration Systems provide you with healthy, clean, filtered, mineralized drinking water. The process is very "Green".

SafeStar's Water Filtration Systems leave natural minerals and salts in the water while removing odours, chlorine, manganese, copper, lead, bacteria and cysts. Our systems are easily installed with water in and water out connections.

Designed for Unlimited Filtered Water Supply -

Using existing water pressure, SafeStar's Water Filtration Systems provide you with continuous supply of healthy filtered water.

Convenient - SafeStar's Water Filtration Systems provide you with unlimited, healthy filtered water. Practically maintenance free with no moving parts.

Great Tasting - You can now enjoy great tasting water with better than bottle water quality.

Environment Friendly - By using SafeStar's Water Filtration Systems, you will be helping to lower carbon emissions and lighten the load at landfill sights.

With SafeStar's Water Filtration Systems, there are no bottles involved. This is a major step towards a greener planet.

SafeStar's Water Filtration System #2 takes treated city water and processes it through three additional steps. These three steps use very little electricity and no chemicals are added. The resulting water is clean, healthy and delicious to the taste. The system operates on city water pressure and has no internal moving parts.

Step One: Incoming city water enters the **Sediment Filter**, a 50-5 micron pre-filter. (A human hair has a diameter of approximately 50 microns.) The purpose of the pre-filter is to remove any contaminants that may have dislodged from the city water pipes, enroute to your location from the city's water purification plant many miles away. It is a known fact that most city water mains are deteriorating rapidly, needing replacement.

Step Two: Now the mineralized pure water travels to the **Activated Charcoal Filter**. This filter removes the chlorine that the city added for protection, during distribution through their water mains. It also removes potentially harmful manganese, copper, lead and mercury. As the water exits this filter, it is not only super pure, but it smells and tastes great, and is full of nature's natural minerals and salts.

Step Three: The water now travels through the **Ultra-Violet Light**. This unit, and its computer controller, irradiate any micro-organisms that may have slipped by the previous steps of purification. Although the odds of this happening are extremely low, the SafeStar Water Filtration System has included this high-tech step as a final "Insurance Policy" to protect your health and confidence.
